You have a dimension table named Table1 that has 10,000 rows. The rows are used to generate several reports. The reports join a column that is the primary key. The execution plan contains bookmark lookups for Table1. You discover that the reports run slower than expected. You need to reduce the amount of time it takes to run the reports. Solution: You create a nonclustered index on the primary key column that does NOT include columns. Does this meet the goal? A. Yes B. No Answer: A Explanation: <https://docs.microsoft.com/en-us/sql/relational-databases/indexes/clustered-and-nonclustered-indexes-described?view=sql-server-2017> NEW QUESTION 194 You have a table named Person that contains information about employees. Users are requesting a way to access specific columns from the Person table without specifying the Person table in the query statement. The columns that users can access will be determined when the query is running against the data. You need to ensure that users can access the needed columns while minimizing storage on the database server. What should you implement? A. the COALESCE function B. a view C. a table-valued function D. the TRY_PARSE function E. a stored procedure F. the ISNULL function G. a scalar function H. the TRY_CONVERT function Answer: B Explanation: <https://docs.microsoft.com/en-us/sql/t-sql/statements/create-view-transact-sql?view=sql-server-2017> NEW QUESTION 195 You have a date related query that would benefit from an indexed view.
